

Industrial supervisor: Mr. Vadim OKUN

Academic supervisor: Mr. Charles DESPRES

How to inject quality bugs for Static Analysis Tool Exposition's test cases

Guillaume HABEN's Oral Defense

December 1, 2017

***“How do you change the world?
Always work on something
uncomfortably exciting”***

– Larry Page, Alphabet CEO

Outline

Introduction

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

Conclusion

Introduction

One of the biggest data breaches of all time

145 millions Americans affected

\$59.5 billion annually

1. Context & environment

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

NIST
**National Institute of
Standards and Technology**
U.S. Department of Commerce

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

Software Assurance Metrics And Tool Evaluation

- Improving software assurance
- Measuring the effectiveness of tools

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

Static analysis

Input

Tool analysis

Output

Source code

Warning reports

Limits

1. **Context & environment**
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

Complexity of real world software

Use of approximations

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

Static Analysis Tool Exposition

- Encourage improvement of tools
- Speed tool adoption
- Enable empirical research

2. Presentation of the project

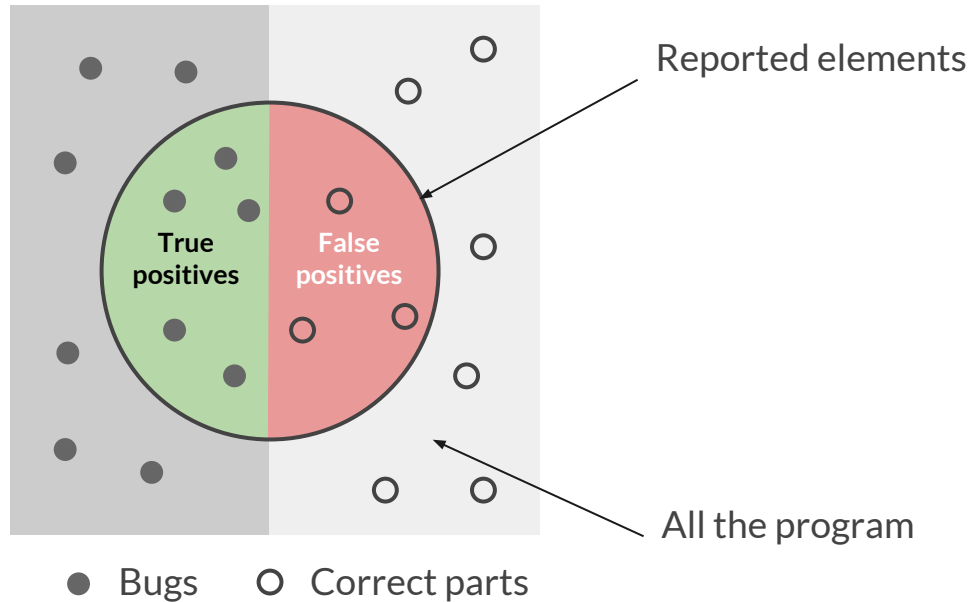

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

What do we want to know ?

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

Precision & Recall

$$\text{Precision} = \frac{\text{True positives}}{\text{True positives} + \text{False positives}}$$

$$\text{Recall} = \frac{\text{True positives}}{\text{True positives} + \text{False negatives}}$$

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

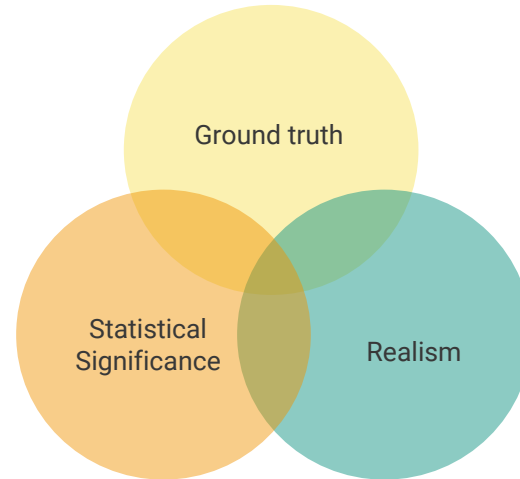

How to assess static analyzers ?

1. Context & environment
2. **Presentation of the project**
3. Design of the solution
4. Results & future outlook

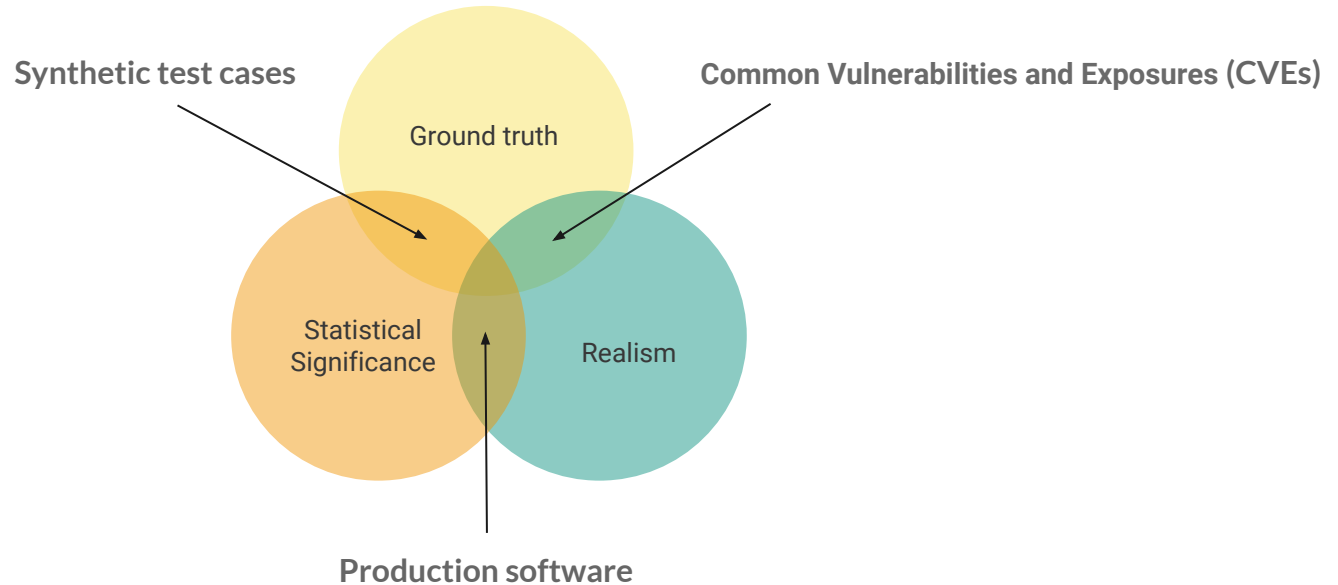

Test case's characteristics

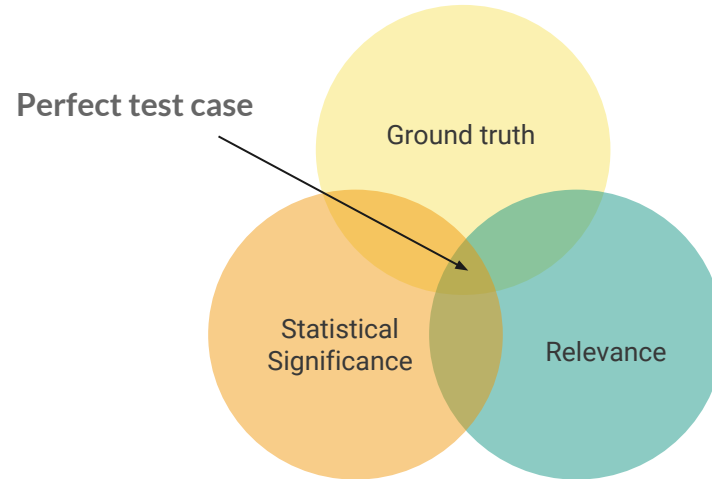

1. Context & environment
2. **Presentation of the project**
3. Design of the solution
4. Results & future outlook

Existing test cases

1. Context & environment
2. **Presentation of the project**
3. Design of the solution
4. Results & future outlook

Benefits of bug injection in Production Software

3. Design of the solution

How to inject quality bugs in Production Software?

1. Context & environment
2. Presentation of the project
3. **Design of the solution**
4. Results & future outlook

Requirements

 A program

Bugs

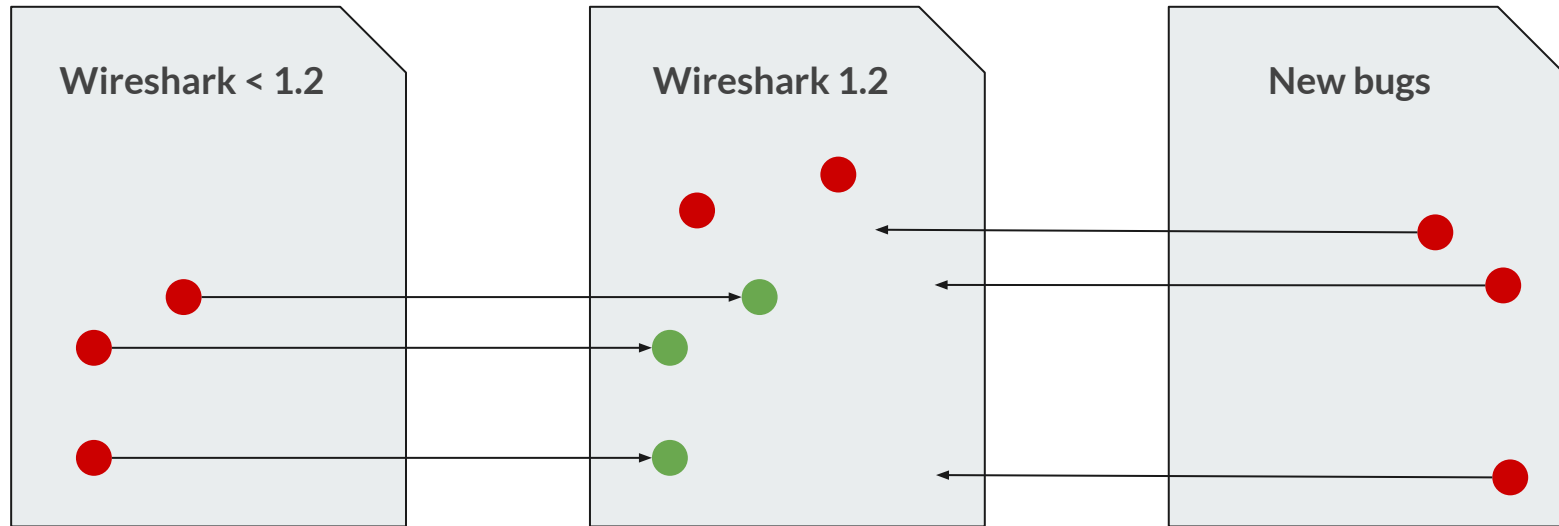

Fixes

Triggering inputs

1. Context & environment
2. Presentation of the project
3. **Design of the solution**
4. Results & future outlook

Different ways to inject bugs

1. Context & environment
2. Presentation of the project
3. **Design of the solution**
4. Results & future outlook

Different ways to inject bugs

	Pros	Cons
Existing bugs (reported)	<ul style="list-style-type: none">• Real by definition• Easy to add• Come with triggering inputs & fixes	<ul style="list-style-type: none">• Only a small amount existing
Injected bugs	<ul style="list-style-type: none">• Choice of the category• We can inject a lot of them	<ul style="list-style-type: none">• Creating a bug, its fix and its triggering input is time-consuming

1. Context & environment
2. Presentation of the project
3. **Design of the solution**
4. Results & future outlook

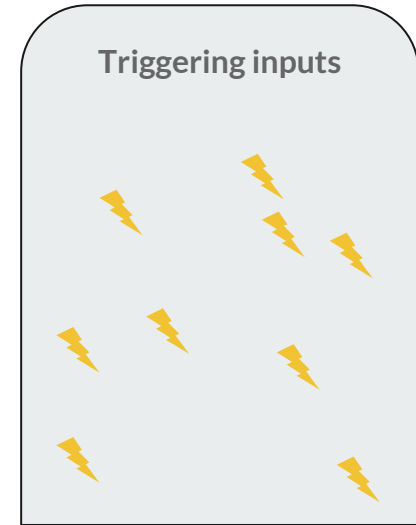

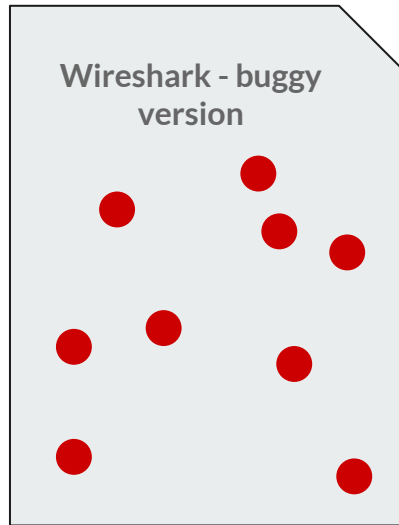

Suggested criteria for bug's quality

- Reflect a programmer's way of coding
- Bug complexity
- Span the execution lifetime of a program
- Come with an input that serves as an existence proof
- Manifest for a very small fraction of possible inputs

1. Context & environment
2. Presentation of the project
3. **Design of the solution**
4. Results & future outlook

The prepared test case

4. Results & future outlook

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. **Results & future outlook**

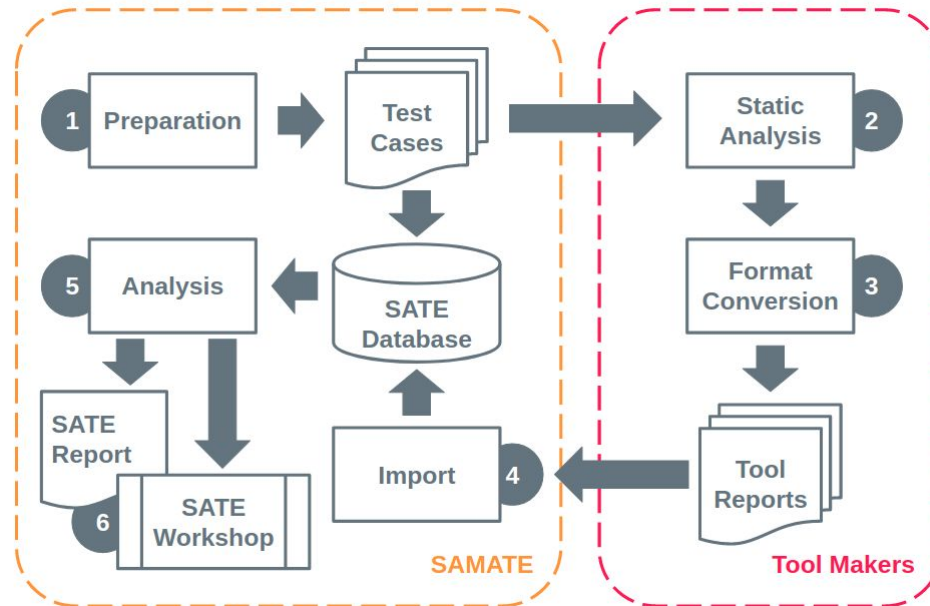

Results

New approach for assessing static analyzers in SATE VI.

~ 50 quality bugs injected

1. Context & environment
2. Presentation of the project
3. Design of the solution
4. Results & future outlook

What now?

Conclusion

- Awareness on software security
 - Versatility
 - Great experience at NIST
-
- SATE VI test cases ready
 - 8 months of training so far

Any Questions?

Bug example

```
nresp = packet_get_int();

#if defined(BUG_7DD70701) // Compiling the version with the bug
if (nresp > 0 && nresp < 1048576) {
#else // Compiling the correct version
if (nresp > 0) {
#endif

response = malloc(nresp * sizeof(char*));

for (i = 0; i < nresp; i++)
    response[i] = packet_get_string(NULL);
}
```
